

Forging Press Installations

Forging presses can be installed using either Vibro/Dynamics® Elastomer Isolators or Viscous Spring Mounts, depending on the installation and isolation requirements.

Micro/Level® Elastomer Isolators offer easier, faster installations, precision leveling and alignment; and excellent vibration and impact force isolation.

FSV™ and FSX™ viscous damped spring isolators are recommended when shock isolation requirements are high. These isolators are relatively soft, so direct mounting of the press on spring isolators may result in greater than desired motion caused by the press rocking forces. Motion can be reduced by using a steel plate or outrigger beams effectively increasing the wheelbase of the machine.

The choice is yours! Vibro/Dynamics Application Engineering Department is available to assist you in the isolator selection process.

Forging Presses can be installed using Micro/Level® Elastomeric Isolators or FS Type Spring Mounts with outriggers.

Your best way to install forging machinery
for effective control of vibration and shock

MRM™ Isolation Systems

MRM™ Isolation Systems are specially designed for die forgers and drop hammers. These revolutionary new products have the simplicity of a layered elastomer system, with shock isolation effectiveness similar to viscous spring isolators.

MRM Isolation Systems feature thick, soft, elastomer modules for greater vibration and shock control. Vertical dynamic natural frequencies as low as 8 Hz are achievable. Typical isolation efficiency is 60-80% reduction compared to traditional oak-timber systems

MRM Isolation Systems feature unitized construction. Each Element is constructed using alternating layers of custom elastomer modules and galvanized steel sheets that are securely fastened together. The elastomer modules are molded from proprietary compounds for superior shock isolation, durability, and creep resistance. Each Element is encased in a protective foam barrier for further protection against pit debris.

All MRM Isolation Elements are designed to be simply lowered into the foundation as complete units. No difficult and time-consuming layout and “in the pit” stacking of pads and plates is required!

The unique design features of the MRM Isolation Systems result in superior shock isolation, trouble-free installations and long lasting performance.

Elements quickly installed and arranged in pit.

Viscous Damped Spring Mounts

FSV™ and FSX™ Spring Mounts provide the ultimate in shock isolation effectiveness. Their low stiffness and natural frequency results in shock isolation in the 80-90 percent range. Hammer motion is controlled by a very sophisticated viscous damper design, providing a fast decay of motion between hammer blows.

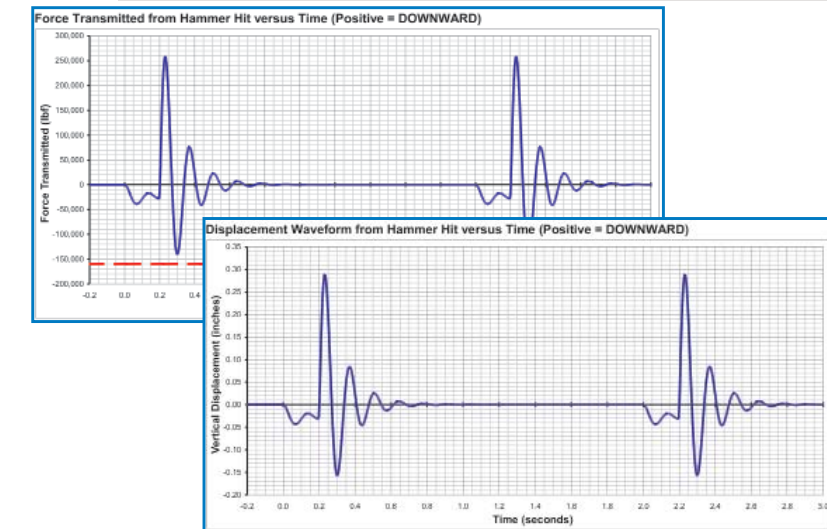

The heavy-duty, stress relieved fabrication is made to hold-up under the severe operating conditions typical to forging industry.
